Is social media doing more harm than good?
Definitely, the social media is good for the development of society. Even though most of people argue that social media will spread so many fake information, which can mislead some people in reality world, we should also agree that the true information social media can provide for us is far more. Especially for nowadays, if we are isolated by any types of social media, it can be said that we are isolated by the whole world. That gives more harm to ourselves, since we will be blocked by the cage of our own world of cognition.

Before using AI
- Is it better to have 1 or 100 friends?
It is always better to have 1 friend than 100. It goes back to the age old saying ‘quality over quantity.’ One of the core principles of friendship is trust. Being able to truly and deeply understand and trust a person, and for them to trust you. Trust requires closeness, it requires that you spend time with them and that you experience the world with them. Physically, this type of trust is not feasible with 100 people. We are not wired to trust or truly know 100 people. We don’t have the time to cultivate deep and meaningful friendships with 100 people. 100 people is a lot of people. A room full of 100 people would be a full room. While some might say that 100 friends is ideal, giving you the opportunity to hear 100 different perspectives, learn about 100 different view points and experiences, how deep would these friendships truly be? Would they actually be friendships or would it just be 100 people who you are just slightly more than acquaintances with? 1 friend

however, is much better. One friend to truly be your rock. One friend to truly listen to you. And one friend who truly knows you and you know them.

After using AI
- Is it better to have 1 or 100 friends?
It is always better to have 1 friend. One friend who you can trust, one friend who you can know and one friend who truly knows you and has your back. Some might say that 100 friends is better. 100 different perspectives, 100 different people with different connections and knowledge to help you. But how deep are these connections and how can we truly know 100 different people? Having one trusted friend means you are never alone, you have one person to rely on and they can rely on you. Quality is always better than quantity. Also, do you really have the time or the energy to deeply cultivate 100 different friendships, and so then how can these friendships be true? Some might say that by having one friend, you are more open to their moods and the friendship might be more unstable if they were to change or something were to happen? But so too are you not open to the moods and whims of 100 people if you have 100 friends. Yes, you might have more people to confide in but also you have 99 more people to appease, 99 more people to manage and 99 more options to consider. Your friendships are probably not as deep if you have 100 and therefore they are just as rocky. There are pros and cons to both 1 and 100 friends but there is nothing that can ever beat having one true friend.

Should billionaires exist?
It is crazy to state the billionaires should not exist, however, when you examine the facts, this claims starts to look less absurd. A billionaire dollars is an amount so obscene, no one could spend all their money in their lifetime even if they tried. Indeed, there is a psychological effect were billionaires believe they have everything and so much power and decide to do crazy things with it. Billionaires like Bryan Johnson who only goal is to live forever. He spends his days trying extreme things or having weird routines just to live longer his rich life.

It's not just about how you live your life, it how people can get that kind of money. There is no billionaire that is rich because they were just smart or ahead of the curve. Sure, it takes grit and many are talented people, but at it's core to become that rich you either have to be born rich or exploit others. Only by exploiting others do your gains become so large. The existence of billionaires themselves shows the exploitation and corrupt system of the

world. I am not saying banish billionaires, but I am saying the existence of them shows systematic unfairness and in an ideal world billionaires should not exist if the world is fair.

After using AI:
It is crazy to state the billionaires should not exist, however, when you examine the facts, this claims starts to look less absurd. A billionaire dollars is an amount so obscene, no one could spend all their money in their lifetime even if they tried. You would need to spend 100,000 dollars every single day for 25 years just to come close to being poor. A task virtually impossible especially given billionaires nature.

When a person becomes a billionaire, they start to think they have unlimited power because some of their desires can be bought at click of a finger. This leads to strange behaviors like billionaire Bryan Johnson who only goal is to live forever. He spends his days trying extreme things or having weird routines just to live longer his rich life. Or the more recent scandalous case of Jeffery Epstein were it was revealed that many elite socialites actually part take in atrocious actions. Many people have commented that if the people committing these crimes were not rich they would not be persecuted.

Sure, it is true that they have even arrested people like prince Andrew, but only for a show, we was released after a single day. It must also be said that often billionaires drive innovation, as many public institutions do not have that kind of money to drive such change. However, do we really want to be guided by single persons whims and ego?

Billionaires have donated to charity and have helped support many people. Nonetheless, to become a billionaire means you are exploiting others as there is no other way you can become so rich.

Is it better to have 100 average friends or 1 best friend?
For me, it is better to have a best friend rather than 100 average friends, as I always believe that the quality of friends matter much than quantity, based on the following reasons.

A best friend is your soul mate who share the same values with you. No matter what you are experiencing and going through, they understand your mind and will support you along the way. When you encounter difficulties, they would definitely reach out their hands for you. However, for average friends, the don't share the same feelings with you as they would never go deep into what you are going through, and they probably really care much about you. Likewise, you cannot share you feelings with all 100 average friends. So from my perspective, a best friend definitely worthy much for me.

Second version/ after use:
For me, it is better to have a best friend rather than 100 average friends based on two dimensions: trust and support. In terms of trust, have a best friends means there is a guy who you can trust, no matter what you do, and you are surely know that he will always be there with you. Besides, have a best friend can provide in-depth emotional support for you when you are encountering lows in your life. He will definitely understand and support you along the way. There isn't any word needed.
However, having 1000 average friends could be very superficial, your friends don't really share the same thoughts with you, and you hardly can go deep into a topic with any of them as you are just average to each other, even though they may sometimes provide you with broader perspectives. But in terms of emotional support, depth matters much than broad. It is something that only a truly best friend can provide to you.
In a word, a best friend could be way better than 100 average friends.

It is honestly quite embarrassing that in 2026 the British Museum still holds onto the Parthenon Marbles. It is just an example of how much "heritage" is just stuff taken from other people. The main argument for keeping them is that they are safer in London, but that is just a lie because Athens has a world-class museum right next to the Acropolis now. Keeping them is just a symbol of old colonial power that doesn't exist anymore. If we want to be a modern society that respects other cultures, we have to give back what was stolen. Lord Elgin didn't even have proper permission to take them, he just took advantage of a messy political situation with the Ottomans. It's time to stop making excuses and just send them home.

After AI:
It is honestly quite embarrassing that in 2026 the British museum still holds onto the Parthenon Marbles; it’s the ultimate finds keepers approach to history. They claims that keeping them in London allows them to be seen in a global context alongside Egyptian or Assyrian art. Some also claim that if we return these, every gallery in Europe will end up empty because of a slippery slope of claims. But that a massive reach. Most artifacts aren't literally hacked off a standing unesco world heritage site like these were.

There is also the argument that they are more safe in than in the Acropolis museum. But that is a lie. The Acropolis museum is world class museum. Plus, the legal side is super shady. Lord Elgin permission came from an Ottoman firman that many historians, like David St. Clair, have argued didn't actually give him the right to remove sculptures from the building itself. He just took advantage of a messy political occupation. If we want to be a modern society that respects other cultures, we have to give back what was stolen. These aren’t just objects but they are part of a building that belongs to Athens.

Is the hippopotamus the best land mammal to win a fight?
Hippos are the most dominant land mammal because their physical power and defensive capabilities far exceed those of any potential rival. Their huge size and surprising speed, make them one of worlds greatest beasts. Their biggest and most powerful advantage is their colossal jaws, one bite is strong enough to snap a canoe in half and powerful enough to crush bone with ease. This combined with their aggressive temperament, makes them uniquely equipped to defeat any predator which challenges them. Lions, crocodiles, and even groups of large mammals routinely yield to hippos, not out of caution but out of recognition that confronting them is a losing strategy. Their mass, speed, character, and bite, makes them a clear victor in any confrontation.

After AI:
Is the hippopotamus the best land mammal to win a fight?

Hippos are the most dominant land mammal because their physical power and defensive capabilities far exceed those of any potential rival. Most people may think these creatures are slow bloated sausages, but they are actually terrifyingly fast. A hippo can run up to 30 km/h and weight a lot! If you calculate the momentum involved in a hippo charge, its basically like being hit by a fright train made of muscle. People may argue that a lion is the king of the animal kingdom, but a lion can't even make a scratch on a hippo's thick skin. Plus have you seen their jaws? Their jaws carry a powerful bite capable of destroying any animal that dares to challenge them. Sure, you could argue that an elephant has the size advantage, but hippos have this insane "low center of gravity" and a level of agression that defies any logical survival instinct.

Is online learning better than in-person learning?

If you were to compare online learning with in person learning, you may finish with the same content understood, but the actual teaching and learning will be very different. Online learning can be considered better than in person learning regarding the teaching as it puts students in an environment where they have less distractions from friends and as a result, may be better able to focus on the content. Additionally, they have more time to digest the content and do further reading as the commute time is eliminated. Nevertheless, this may only be the case for more academically inclined students who enjoy studying. Those who dislike it may get more easily distracted in their bedrooms and decide not to participate in the classroom. Therefore, online learning may be better for learning for those who do well in school, but can be detrimental for those who have a strong hatred against it leading to high procrastination.

Is there any merit to the US's ambitions over Greenland?
I believe the United States's ambitions to take over Greenland are still internationally unjustified since it is a sovereign nation and part of NATO. That being said, if you argue from the point of view of American interests alone, it is possible to see long-term economic and geopolitical benefits for them, assuming they manage to maintain their relationship with NATO countries through a purchase deal or a referendum vote of Greenland,d where they choose to join the US and leave the Kingdom of Denmark. Furthermore, if the US invests in the people of Greenland, develops its infrastructure, and maintains NATO security for all allied members, that can justify the US's ambitions in Greenland.

After AI:
Is there any merit to the US's ambitions over Greenland?
Greenland's location in the Arctic is clearly important in geopolitics, as it lies between the US and Russia and is a frozen, underdeveloped land where missiles and military bases can be stationed. The US claims that having control over Greenland is essential to US national security. While I agree that Greenland is strategic to US ambitions, I strongly oppose the US's ambitions to unite Greenland with the US. Firstly, Greenland, part of the Kingdom of Denmark, is a part of NATO and a close ally of the US. They already allow the US to operate military bases. In fact, the US has reduced its presence in the Arctic over the years and can still reinstall its bases. Furthermore, while US national security is important to the US, aggression against a sovereign nation and a close ally, part of the strongest military alliance to ever exist, threatens international stability and US strength. Secondly, the claim is that if the US does not take control of Greenland, China's presence in the Arctic will be mostly baseless, since China's presence in the Arctic was completely removed during the first Trump administration. Overall, my claim is that the US's aggressive ambitions over Greenland are purely territorial and driven by Trump's ego rather than by national security.

Is adult hippocampal neurogenesis necessary to recover from stressed induced depression?

Chronic stress or early life stressors have been shown to correlate with depression and increase chance to relapse of depressive symptoms. This is believed to be because the HPA axis becomes dysregulated and there is a constant high level of cortisol being released by the adrenal glands. This glucocorticoids travels through the blood to then act in most cells of the body through its receptor (GR) is thought when in high concentrations for long to have detrimental effects on the brain. The hippocampus specifically has a huge concentration of GR is thought to be very vulnerable; usually it has a negative feedback role on the HPA axis but in chronically stressed people is thought to not do this anymore. Many antidepressant drugs that change neurotransmitter levels in the brain actually take a long time to reduce depressive szptoms even if the neurotransmitter ells are changed almost immediately, for this reason isìt is thought to be some other mechanism downstream; scientists have shown that many of these adnitdperessants actually activated the BDNF receptor leading to neurogenesis; specidfically in the hippocampus ; and therefore that is this mechainsism that teals to better regulation of the HPA axis and so recovers od depressive symptoms.

After Ai use:

Chronic stress dysregulates the HPA axis, leading to persstent cortisol release that damages the hippocampus**,** a region vital for stress regulation via its high density of glucocorticoid receptors.

The neurogenesis hypothesis explains the delayed effiacy of antidepressants: while neurotransmitter levels change quickly, clinical recovery likely requires downstream BDNF activation to generate new hippocampal neurons.The neurogenesis hypothesis helps explain why antidepressants, often take weeks to improve a patient mood. This delay suggests a downstream mechanism: many antidepressants activate BDNF receptors, which trigger adult hippocampal neurogenesis. However, the necessity of neurogenesis

remains a point of debate. Counter-evidence suggests that some patients show recovery through synaptic plasticity rather than the birth of new neurons. Furthermore, animal studies have shown that blocking neurogenesis doesn't always prevent antidepressants from working in every behavioral test. Therefore, while hippocampal neurogenesis is a primary driver of recovery, it may be part of a broader network of structural repairs required to reverse stress-induced depression.
